

Surgery recorder (Hopefully, the leader is wanted before Wataru's hospitalization. It is one week stay from 2024/5/16 at [NCVC](#))

There is a potential risk for patients while you have a surgery/operation/inspection that your medical team makes intentional/unintentional mistakes. To avoid such a situation, we construct our convincing system to record the surgery situation as well as medical doctors' visits and so on. All the staff in the room should be shot in a camera and the responsible doctor should explain the expected cases and response in advance.

Additionally, after compiling the service experience, we potentially provide services to avoid conflicts with patients for medical doctors as well as insurance for doctors.

We recommend the service be implemented in hospitals eventually because a surgery team won't be disturbed if the service is conducted by the staff.

By the way, insurance companies should notify about the contract to the event-relevant people (i.e. to the insured people, about the contractor).

The requirement for the project leader,

1. Accountability for customers/monitors, employees, investors, and stakeholders (medical/health care industries and researchers).
2. Explicit support for our activities such as hiring [our project reviewers](#) and supporting [Publishers for Scientific Journal](#).
3. Understanding of intentional/unintentional mistakes and capability to handle the potential conflicts before the low case as well as making incidents transparent considering relevant people's privacy.
4. Understanding the potential risk of recent technologies such as [doctors2vec](#), [researchers2vec](#), [wikieditors2vec](#), and so on. Outreach the risk to induce peaceful settlement in our society.

NOTE: As we discussed [somewhere else](#), we hope to have means to verify that the medical data is ours. For example,

- **Xray:** An ID (i.e. barcode) should be included in the X-ray. Unique accessories such as short necklaces might also work.
- **Electrocardiogram:** Before the recording, a unique signal can be applied as an ID.
- **Blood work:** A patient can choose one from a set of needles.

NOTE: Currently, Wataru is trying to negotiate to use a non-invasive examination at the examination hospitalization (2024/5/16-22). However, the medical doctor recommended a catheter examination which has a higher risk according to [the NCVC website article](#). Therefore, Wataru would like to use the service as a monitor at the examination (2024/5/18,19?). Although Wataru needs to save money for safe accommodation and safe food, the service fee is negotiable (Wataru thought the standard price is 10,000 - 20,000 yen/examination or surgery without medical insurance). Also, since Wataru has to clear the balance in the US debt and return the Japanese scholarship loan, please do not expect a lot.

NOTE: Unfortunately, the current Japanese medical framework might not be able to provide the service (The request to record the examination was rejected on 2024/4/23). Thus, we are looking for someone who can negotiate and arrange with [NCVC](#) to record the examination. (Wataru will pay the service fee after the [NCVC](#) acceptance). However, if Wataru is successful in conducting the non-invasive examination at the [NCVC](#), we can have more time.
